PROFESSIONAL SUMMARY

- Software Engineering student at 42 Network seeking Software Engineering and AI internships. Expertise spans low-level C++ programming, scalable backend infrastructure, and advanced NLP systems. Demonstrated success building highly concurrent web servers and containerized, multi-agent RAG pipelines using local LLMs and vector databases.

TECHNICAL SKILLS

Programming Languages: C, C++, Python, Java, JavaScript, Shell / Bash, SQL

Web Frameworks: Tailwind CSS, Next.js, shadcn, Django, Spring Boot, PostgreSQL

DevOps: Git, GitHub, Docker

AI / ML: RAG, LangChain, LangGraph, Ollama, HuggingFace, pgvector, Python AI stack

Spoken languages: English, Arabic

PROJECTS

- **Multi-Agent RAG System — Technical Hiring Assistant**
 - Enhanced Search Accuracy: Built a semantic search pipeline (Hugging Face, pgvector) to process 200+ resumes, boosting retrieval precision from 0.62 to 0.80 via reranking.
 - Automated AI Workflows: Engineered a 3-agent system (LangGraph) to parse resumes, score candidates, and generate interview questions, with a smart fallback to human review.
 - Smart Data Mapping: Integrated a Neo4j knowledge graph to map candidate-skill relationships, making AI search results highly accurate and easily explainable.
 - Optimized Deployment: Containerized the full stack (Docker Compose, FastAPI) and ran a local LLM (Mistral 7B via Ollama), delivering extremely fast sub-800ms response times. [GitHub](#)
- **Wesellia — On-Demand Delivery Platform**
 - Architected and developed a peer-to-peer delivery marketplace connecting 100+ clients with 50+ independent shippers for last-mile logistics.
 - Engineered real-time order matching and geolocation-based discovery to pair requests with the nearest available couriers in under 30 seconds
 - Implemented an innovative pricing mechanism that facilitated 95% + successful agreements between clients and shippers
 - Built asynchronous order tracking to provide 24/7 end-to-end status visibility across 3 user interfaces.
 - Designed the platform around 2 core user types and 4 main workflows: request creation, courier matching, negotiation, and tracking. [more.](#)
- **Docker Infrastructure**

create a fully containerized web platform from scratch using Docker and Docker Compose. Developed custom Docker images, configured NGINX reverse proxy with HTTPS/TLS, integrated WordPress with MariaDB, and applied persistent volumes and secure container networking. Deployed a 3-service stack with isolated networking and reproducible local setup. [GitHub](#)
- **HTTP Web Server**

Implemented a fully functional HTTP/1.1 web server from scratch in C++, handling GET, POST, and DELETE requests, CGI execution, and chunked transfer encoding. Built a low-level socket-based server that supports concurrent I/O with select/poll and strict RFC compliance. Aimed at handling multiple clients while preserving stable request parsing and response generation. [GitHub](#)

EDUCATION

1337 School (42 Network)
Software Engineering

Ben Guerir, Morocco
10/2024 – Present

Peer-to-peer, project-based curriculum (42 Network). No lectures — learn by building. Core topics: Unix/Linux, C/C++, algorithms, data structures, web development, and DevOps.
